

80-Point AEO Audit

Every signal that decides whether AI engines cite you or your competitor. Specific. Practitioner-level. No fluff.

80

AUDIT CHECKPOINTS

6

SIGNAL CATEGORIES

3

AI ENGINES

~30 min

TO COMPLETE

WHY THIS EXISTS

In 2023, a SaaS client ranked #2 on Google for their primary keyword. Zero AI citations. Zero mentions in ChatGPT answers. Zero Perplexity traffic. Great backlinks. Terrible entity coverage. After fixing 34 items from this list, they appeared in 11 AI-generated answers within 6 weeks.

Rankings and AI visibility are now two completely separate strategies. This checklist handles both. It is the same framework used in paid audits.

HOW TO USE THIS

Run this audit on your highest-traffic service pages first, then blog posts.

A page failing 15+ checks is invisible to AI engines — even if it ranks #1 on Google.

Fix Critical items first. They account for 70% of AI citation failures.

PRIORITY LEGEND

CRITICAL

Fix first. Highest AI visibility impact. These alone determine 70% of citation probability.

IMPORTANT

Fix next. Meaningful compounding signal. Skipping these costs you long-term.

STANDARD

Foundation hygiene. Not optional — just lower urgency than the above two.

CATEGORY 01

Content Structure

15 CHECKS

AI engines parse content like a very fast literal reader. If your structure does not telegraph the answer in the first pass, they skip your page entirely and cite the next result.

- ☐ 01 **H1 states the exact query the page targets — in plain English**
ChatGPT and Perplexity extract H1 as the primary topic signal. 'Our SEO Services' fails. 'AEO Services for B2B SaaS Brands' passes.
CRITICAL
- ☐ 02 **The primary answer appears in the first 100 words — before any context**
Perplexity's citation engine weights the opening block most heavily. Burying the answer after a 3-paragraph intro loses 60-70% of citation probability for that query.
CRITICAL
- ☐ 03 **Every H2 is a complete question or declarative sentence — never a label**
'Benefits' tells AI nothing. 'Three Benefits of AEO for SaaS Brands in 2025' is a citable unit. Rewrite every H2 on your top 5 pages this week.
CRITICAL
- ☐ 04 **Each H2 section can be read and understood without reading any other section**
AI engines extract individual sections as standalone answers. A section that references 'the above' or 'as mentioned' fails this and gets skipped for citation.
CRITICAL
- ☐ 05 **The page covers one topic. Not one topic and four tangents.**
Topical scatter is the #1 reason well-written pages get ignored by AI engines. One clear intent per URL. Move tangents to their own pages.
CRITICAL
- ☐ 06 **Paragraphs are 2-3 sentences max. One idea each.**
Dense blocks are skipped by AI parsers. Short paragraphs increase extraction probability. Test: can each paragraph stand alone as a tweet? It should be able to.
IMPORTANT
- ☐ 07 **Bulleted and numbered lists appear wherever you list 3+ items**
Lists are the most-cited content format in AI answers. A paragraph listing five things becomes invisible. The same content as a numbered list gets pulled directly into ChatGPT answers.
IMPORTANT
- ☐ 08 **The page defines the core concept in plain language within the first 300 words**
Google AIO's definition extraction specifically targets pages that state clear, unambiguous definitions early. Jargon-heavy openings get skipped for simpler competitors.
IMPORTANT

- ☐ 09
- A TL;DR or Key Takeaways block exists — either at the top or bottom**
These blocks are AI citation goldmines. Structure them as 3-5 bullets. Label them explicitly ('Key Takeaways:') so engines can identify and extract them.
IMPORTANT
- ☐ 10
- Heading hierarchy is H1 > H2 > H3 with no levels skipped**
Skipping from H1 to H3 breaks semantic parsing. AI engines use the heading tree to understand content relationships. A broken tree means incomplete understanding.
IMPORTANT
- ☐ 11
- Meta title matches the page's primary keyword intent exactly — not a marketing tagline**
AI search engines use title tags as the first intent-matching signal. 'Transforming Your Digital Future' matches zero queries. 'AEO Audit Services for SaaS' matches thousands.
IMPORTANT
- ☐ 12
- Meta description is a complete sentence that answers a question — not a teaser**
Teasers waste the field. A meta description that fully answers 'what does this page cover' gets indexed as supplementary answer content by AI engines.
STANDARD
- ☐ 13
- URL slug uses 2-4 keywords, hyphens only, no dates or IDs**
Clean slugs are a lightweight trust signal. /services/aeo-for-saas scores higher than /services/page?id=4821&cat=seo. Fix legacy URLs with 301s.
STANDARD
- ☐ 14
- Content word count is within 10% of the top 3 ranking pages for the target query**
Depth signals completeness. Thin content (under 600 words on a complex topic) is systematically deprioritized. Use SemRush or Ahrefs to check competitor depth before writing.
STANDARD
- ☐ 15
- The page has been updated or reviewed in the last 6 months — with a visible date**
AI engines track content freshness. A 2022 article on AI search without a 2024+ update date gets deprioritized for any query where recency matters. Add 'Updated: Month Year' to the byline.
STANDARD

CATEGORY 02

Entity Coverage

14 CHECKS

Entities are the people, concepts, tools, and organizations AI knowledge graphs use to understand what a page covers. Without explicit entity signals, content exists in semantic isolation.

- ☐ 16
- The primary topic entity is named at least 3 times using its full, official name**
Entities need to appear with sufficient frequency to be mapped by AI knowledge graphs. One mention is ambiguous. Three mentions in context builds the association.
CRITICAL

☐ 17**Related entities (synonyms, subtopics, parent categories) appear naturally in the content**

If your page about 'AEO' never mentions 'Answer Engine Optimization', 'AI citation', 'AI search visibility', or 'generative search' — it exists in semantic isolation. AI engines need the full entity neighborhood.

CRITICAL

☐ 18**The author or brand entity is explicitly named on the page — not just in the footer**

AI engines assess source credibility per page, not per domain. If a page never names who wrote it or what brand published it, it gets assigned lower trust weight in citation scoring.

CRITICAL

☐ 19**Industry-specific technical terms are used accurately and consistently throughout**

Inaccurate terminology is a red flag for AI quality scoring. Using 'keywords' when you mean 'entities', or 'SEO' when you mean 'AEO', signals shallow expertise and reduces citation probability.

CRITICAL

☐ 20**Specific tools, platforms, or named services are referenced where relevant**

Tool mentions are entity anchors. 'We use analytics tools' is semantically empty. 'We use SEMrush for keyword gap analysis and Screaming Frog for crawl audits' gives AI engines real entity hooks.

IMPORTANT

☐ 21**Statistics and data points are attributed to named sources — inline, not just in a bibliography**

Attributed data is citeable. Unattributed data is treated as unverifiable opinion. Write '42% of searches return zero-click results (SparkToro, 2024)' — not '42% of searches...'

IMPORTANT

☐ 22**Author credentials are mentioned somewhere on the page — years of experience, role, or results**

Google AIO's E-E-A-T scoring looks for demonstrated experience signals on the page itself. A byline that says 'By Shivam Attri' with zero context scores lower than one with a one-line credential.

IMPORTANT

☐ 23**The content covers the topic from at least 3 angles: what it is, why it matters, how to do it**

Single-angle content (only definitional, or only how-to) gets cited for one query type. Multi-angle content gets cited across a broader range of related queries.

IMPORTANT

☐ 24**No filler phrases are present: no 'in today's digital landscape', 'it's important to note', 'leverage'**

These phrases are entity-diluters. Every word on the page should carry either an entity signal or a semantic relationship. Filler words are noise that reduces information density and citation quality.

IMPORTANT

☐ 25**Dates and timeframes appear wherever the content has a temporal dimension**

AI engines downrank undated content for any time-sensitive query. If you're discussing AI search trends without saying '2024' or '2025', you're competing with dated content and losing.

STANDARD

☐ 26 **Specific numbers are used instead of vague ranges wherever possible**

'Significantly faster' loses to '3.2x faster'. Specific numbers are entity-anchors that AI engines extract and cite directly. Vague claims are never cited as supporting evidence.

STANDARD

☐ 27 **Acronyms are spelled out on first use with the acronym in parentheses immediately after**

AEO on a page that never defines 'Answer Engine Optimization' is semantically incomplete. Spell it out once. AI engines map acronyms to full forms — if you don't provide the mapping, they may not make the connection.

STANDARD

☐ 28 **The page does not cannibalize another page on the same domain for the same primary entity**

Two pages competing for the same entity topic split authority signals between them. Combined, they might rank #1. Separate, they often rank #8 and #12. Canonicalize or merge.

STANDARD

☐ 29 **Internal links from this page use anchor text that describes the destination's topic — not 'here' or 'click'**

Anchor text is a topical signal for both the source and destination. 'Click here for our services' passes zero context. 'See how AEO services work for B2B SaaS' passes full topical weight.

STANDARD

CATEGORY 03

FAQ & Schema

13 CHECKS

Schema markup is how you talk directly to machines. FAQ blocks are the highest-conversion AEO format available. Together they are the fastest path to AI citation for most pages.

☐ 30 **FAQPage JSON-LD schema is implemented with at least 5 questions drawn from real search queries**

Use 'People also ask' from Google and Perplexity's suggested questions to source real queries. Marketing-invented questions ('Why choose us?') are never triggered by AI engines.

CRITICAL

☐ 31 **Each FAQ answer is 60-120 words — complete, specific, and standalone**

AI engines extract FAQ answers verbatim. A 10-word answer gets cited as a 10-word answer, which often lacks context. A 90-word answer that fully addresses the question gets cited as a complete, usable response.

CRITICAL

☐ 32 **All structured data is implemented as JSON-LD in the page head — not Microdata or inline attributes**

Microdata and RDFa are deprecated in practice. All three major AI search engines — ChatGPT's web search, Perplexity, and Google AIO — parse JSON-LD preferentially. Mixed formats cause partial parsing.

CRITICAL

☐ 33 **Article or BlogPosting schema is on every blog post with datePublished, dateModified, and author**

Without Article schema, AI engines have to infer content type, author, and date from page structure — and they often get it wrong. Explicit schema eliminates the guesswork and improves citation accuracy.

CRITICAL

- ☐ 34
- Organization or Person schema on the homepage includes sameAs links to all active social profiles**

sameAs links connect your brand entity to the knowledge graph. LinkedIn, Twitter/X, Substack — each link strengthens the entity graph connection and increases your brand's citation authority across all pages.

IMPORTANT
- ☐ 35
- BreadcrumbList schema is implemented sitewide and reflects the actual URL hierarchy**

Breadcrumbs help AI engines understand where a page sits in the content architecture. Pages without breadcrumb context are harder to classify topically, which reduces their cluster authority.

IMPORTANT
- ☐ 36
- Schema is validated in Google's Rich Results Test with zero errors and zero warnings**

Invalid schema is completely ignored by Google and often ignored by other engines. Run every page through Rich Results Test before considering it done. Warnings count as failures for AI visibility purposes.

IMPORTANT
- ☐ 37
- HowTo schema is on every instructional or step-by-step page**

Perplexity is particularly aggressive about citing HowTo-marked content for process queries. A how-to article without HowTo schema competes blind against structured competitors.

IMPORTANT
- ☐ 38
- Product or Service schema is on service pages — with name, description, and provider fields**

Commercial queries in AI search engines trigger structured data parsing first. Service pages without schema are treated as editorial content, not commercial offerings, and get deprioritized for buyer-intent queries.

STANDARD
- ☐ 39
- Schema markup matches visible on-page content exactly — no extra fields, no hidden data**

Google's spam policies penalize schema that describes content not present on the page. Mismatched schema is treated as deceptive and can trigger manual actions that affect all pages on the domain.

STANDARD
- ☐ 40
- dateModified in Article schema is updated whenever the content changes — not left at the original publish date**

Stale dateModified signals stale content to AI engines, even if you rewrote 80% of the article. Update this field every time you make meaningful content changes. Many CMS platforms do this automatically if configured.

STANDARD
- ☐ 41
- Speakable schema is added to the 2-3 key paragraphs best suited for voice or AI summary extraction**

Speakable explicitly flags your best answer passages for audio and AI reading. Most sites don't implement this. The ones that do have a measurable advantage in voice search and AI overview inclusion.

STANDARD
- ☐ 42
- LocalBusiness schema is implemented if any page targets a geographic area or in-person service**

Local AI queries (Perplexity Maps, Google AIO for local) use LocalBusiness schema as the primary data source. Missing it means your local pages compete on text content alone against schema-optimized competitors.

STANDARD

CATEGORY 04

Authority Signals

14 CHECKS

AI engines are citation engines at their core. They cite sources they trust. Trust is built from consistent expertise signals across the full web — not just your own site.

☐ 43 Every content page has a visible author byline with the author's name, photo or avatar, and one-line credential

E-E-A-T scoring is done at the page level, not the domain level. A page with no byline gets a lower trust score regardless of domain authority. Add bylines retroactively to your top 20 pages first.

CRITICAL

☐ 44 The About page describes specific work, specific results, and specific industries — not a mission statement

AI engines crawl About pages to assess source credibility before making citation decisions. 'We're passionate about digital marketing' provides zero credibility signal. '7+ years, 40+ international clients, 150+ websites shipped' does.

CRITICAL

☐ 45 The domain has 15+ referring domains from topically relevant, non-directory sources

Backlink authority is a primary AI source trust signal. A site with 0-5 referring domains needs 80+ on-page checks to compensate. Build links from industry publications, guest posts, and resource mentions first.

CRITICAL

☐ 46 The brand or author is mentioned by name on at least one external domain with editorial authority

Third-party mentions are the strongest trust validators AI engines use. A Forbes mention, an industry newsletter feature, or a podcast interview citation all signal that your expertise is externally validated — not self-declared.

CRITICAL

☐ 47 A contact page with a real email, form, or meeting link is accessible from the main navigation

Contactability is a trust signal in Google's Quality Rater Guidelines and in AI engine quality scoring. Sites with no visible contact path score lower on legitimacy metrics across the board.

IMPORTANT

☐ 48 Social profiles (LinkedIn, Twitter/X, or relevant platform) link to the domain and the domain links back

Bidirectional entity linking strengthens your brand's knowledge graph node. One-way links help. Two-way links with profile-level context create a stronger, more verifiable entity cluster.

IMPORTANT

☐ 49 Outbound links point to authoritative, current sources — no broken links, no low-quality domains

Your outbound link neighborhood signals content quality to AI engines. Linking to authoritative sources (government, academic, established industry publications) improves your own topical credibility score.

IMPORTANT

☐ 50 Content is updated on a clear schedule — at least quarterly for evergreen content

Freshness weighting varies by query type. For AI and tech topics, a page not updated in 12+ months loses significant citation probability to fresher competitors. Set a content review calendar.

IMPORTANT

- ☐ 51 **Privacy Policy and Terms of Service pages exist and are linked from the footer on every page**

These pages are trust infrastructure, not legal formalities. Their absence is flagged by automated quality scoring systems used by both Google and AI engines. Add them before you launch.

IMPORTANT
- ☐ 52 **The site has been live for at least 6 months with consistent content publishing**

New domains are treated with reduced trust by AI engines regardless of content quality. If you're launching a new site, start with structured data and authority signals to compensate for domain age.

IMPORTANT
- ☐ 53 **Case studies with specific, verifiable metrics are published and linked from service pages**

Demonstrated results are the highest-trust authority signal available. '16x click growth in 30 days for a Logistics SaaS' is citeable. 'We helped a client grow their traffic significantly' is noise.

STANDARD
- ☐ 54 **Testimonials from named, verifiable clients appear on service pages — with name, company, and result**

Anonymous testimonials are treated as unverifiable by quality scoring systems. Named testimonials with company context (even just the industry) add social proof that both humans and AI quality raters assess.

STANDARD
- ☐ 55 **No manual actions or security issues are flagged in Google Search Console**

Penalized or flagged domains are systematically deprioritized across all AI and search systems. Check Search Console monthly. Fix any issues before investing in content or AEO optimization.

STANDARD
- ☐ 56 **HTTPS is enabled with a valid SSL certificate and no mixed content warnings**

HTTP sites are excluded from AI citation pools. Mixed content warnings reduce trust scoring even on HTTPS sites. Run your site through SSL Labs or Chrome DevTools to verify clean HTTPS across all pages.

STANDARD

CATEGORY 05

Internal Linking

12 CHECKS

Internal links tell AI crawlers which pages are authoritative hubs and which are supporting content. Without a deliberate linking strategy, topical clusters never consolidate.

- ☐ 57 **Every pillar or hub page links directly to all its supporting cluster pages**

Hub-and-spoke internal linking is how AI engines identify topical authority clusters. If your 'AEO Services' page doesn't link to 'AEO for SaaS', 'AEO Audit', and 'AEO Content Brief' — those pages are invisible to the cluster.

CRITICAL
- ☐ 58 **Every cluster page links back to its pillar page using keyword-anchored text**

Reciprocal linking amplifies topical authority signals across the entire cluster. A cluster page that only links forward (to deeper content) but not up (to the pillar) breaks the authority flow loop.

CRITICAL

☐ 59**No orphan pages exist — every page on the domain has at least one internal link pointing to it**

Orphan pages receive no crawl priority and no authority flow. Use Screaming Frog (free for under 500 URLs) to identify orphans. Add contextual links from related pages before doing any other optimization.

CRITICAL

☐ 60**All important pages are reachable within 3 clicks from the homepage**

Crawl depth is a direct crawl budget signal. Pages at 4+ clicks get crawled less frequently by both Googlebot and AI engine crawlers. Flatten your site architecture or add shortcut links in the navigation.

IMPORTANT

☐ 61**Anchor text on all internal links describes the destination's topic — never 'read more' or 'here'**

Anchor text passes topical context to the destination page. Generic anchors pass nothing. 'See our AEO audit framework' passes the exact topic signal that helps the destination rank for AEO-related queries.

IMPORTANT

☐ 62**Internal links use absolute URLs (https://domain.com/page) — not relative paths (/page)**

Relative paths can cause misattribution when pages are accessed via CDN, subdomains, or scraped by AI engines. Absolute URLs eliminate ambiguity.

IMPORTANT

☐ 63**No broken internal links (HTTP 404 responses) exist on any page**

Run a crawl audit monthly. Broken links signal poor maintenance to quality scorers, bleed crawl budget, and create dead ends for both users and AI crawlers. Fix or redirect every 404.

IMPORTANT

☐ 64**The site navigation links to the primary service and content category pages directly**

Navigation links appear on every page. They carry disproportionately high authority weight because of this. Wasting nav slots on decorative or low-value pages is a structural mistake.

IMPORTANT

☐ 65**Related content links are embedded contextually inside body copy — not only in sidebar widgets**

Contextual in-body links pass stronger topical relevance than sidebar or footer links. AI crawlers weight in-body context links more heavily because they appear in semantic proximity to relevant content.

STANDARD

☐ 66**No redirect chains longer than one hop exist on any internal link**

Each redirect hop loses link equity. A/B > B is fine. A > B > C is wasteful. A > B > C > D is actively harmful. Audit redirect chains with Screaming Frog after any site restructure.

STANDARD

☐ 67**nofollow is not applied to any internal links**

Internal nofollows block PageRank flow unnecessarily. nofollow is for external, untrusted, or sponsored links only. Applying it internally is a common mistake that fragments authority distribution.

STANDARD

- ☐ 68
- The XML sitemap is current, includes all indexable URLs, and is submitted to Google Search Console**

AI engine crawlers use sitemap data to discover and prioritize pages — particularly Perplexity and Bing's AI systems. An outdated or incomplete sitemap means new content gets discovered later and crawled less often.

STANDARD

CATEGORY 06

AI Bot Crawlability

12 CHECKS

Most sites block AI crawlers entirely by accident. This category is technical and non-negotiable. If bots cannot read your content, every other check in this audit is irrelevant.

- ☐ 69
- robots.txt explicitly allows GPTBot, ClaudeBot, PerplexityBot, and Bingbot**

Check your robots.txt right now. Disallow: / is a common inherited default that blocks everything. Many sites block AI crawlers by accident after a CMS update or security plugin change. This is the #1 AEO failure.

CRITICAL
- ☐ 70
- All critical content is in the initial HTML response — not injected by JavaScript after load**

AI crawlers have inconsistent JS execution. Astro SSG and Next.js SSG/SSR deliver content in the initial HTML response. CRA or client-side-only React does not. Check your page source (Ctrl+U) — if the content isn't there, AI can't see it.

CRITICAL
- ☐ 71
- Page LCP (Largest Contentful Paint) is under 2.5 seconds on mobile 4G**

AI engine crawlers have crawl timeout thresholds. Pages that don't load key content within ~3s are abandoned mid-crawl. Measure with PageSpeed Insights and fix LCP before any content optimization.

CRITICAL
- ☐ 72
- Every page has a self-referencing canonical tag that points to the exact intended URL**

Without a canonical, AI engines may index a paginated, filtered, or parameter-appended version of your URL instead of the clean one. Set canonicals explicitly on every page — don't rely on inference.

CRITICAL
- ☐ 73
- JSON-LD schema is in the initial HTML response — not rendered client-side by JavaScript**

Schema injected via React useEffect or similar client-side patterns is often missed by AI crawlers that don't execute JS fully. Embed JSON-LD in the document head at build time or via server-side rendering.

IMPORTANT
- ☐ 74
- No page content is hidden behind cookie consent banners, login walls, or subscription gates**

AI crawlers cannot click 'Accept' on cookie banners or log in. Any content hidden behind these is invisible to AI citation engines. Keep high-value content publicly accessible — gate premium content on separate URLs.

IMPORTANT
- ☐ 75
- All images have descriptive, keyword-relevant alt text — not file names or empty attributes**

AI vision systems process alt text as content signal. 'img_4821.jpg' or empty alt attributes eliminate all visual content from semantic analysis. Write alt text as if describing the image to someone who cannot see it.

IMPORTANT

☐ 76**Core Web Vitals pass in Google Search Console: LCP < 2.5s, CLS < 0.1, INP < 200ms**

Google's AI systems use the same quality thresholds as search ranking. Failing Core Web Vitals reduces crawl frequency and priority. Fix CLS first (cheapest) then LCP (highest impact). Check the CWV report in GSC monthly.

IMPORTANT

☐ 77**No intrusive interstitials cover content on mobile within the first 30 seconds of page load**

Popups that cover content trigger Google's interstitial penalty and block AI crawlers from reading page content. Cookie banners are exempt if they don't cover the main content. Full-screen email gates are not exempt.

STANDARD

☐ 78**HTML source validates with no critical errors — run through W3C Validator on your top 10 pages**

Malformed HTML causes parser errors that truncate what AI crawlers see. A broken div hierarchy or unclosed tag can make everything after it invisible. Validate quarterly or after major template changes.

STANDARD

☐ 79**Crawl budget is not wasted on paginated, filtered, or session-parameter URLs**

Use noindex on faceted navigation URLs, infinite scroll pages, and search result pages on your own domain. Every crawl budget unit spent on these is one fewer unit spent on your high-value content pages.

STANDARD

☐ 80**If the site targets multiple languages or regions, hreflang is correctly implemented and validated**

Incorrect hreflang causes AI engines to serve the wrong language version to users in different regions, fragmenting authority across duplicates. Validate with hreflang testing tools after any i18n implementation.

STANDARD

Score your page. Know your next move.

Count the checkboxes you ticked. Be honest. "Mostly done" is not done.

0 – 29

Invisible

AI engines cannot find, understand, or trust you. Start with crawlability (checks 69-80), then entity coverage (16-29), then schema (30-42). Do not invest in content until these three are solid.

30 – 59

Partially Visible

You appear for some queries but lose citation opportunities to more structured competitors. Fix all Critical items first. Then build FAQ schema and internal linking clusters.

60 – 80

AI-Ready

Your site is structurally positioned for AI citations. The game now is topical authority depth and consistent publishing. Sites that stay at 60+ are the ones AI engines cite repeatedly.

THE HONEST REALITY

Most sites score between 18 and 35 on their first run. That is not a failure. The brands that dominate AI search over the next 24 months are not the ones with the biggest budgets. They are the ones fixing structural gaps before competitors realize those gaps exist.

This checklist is the same framework used in paid client audits. The difference between a site at 22 and a site at 67 is execution, not strategy.

FIX THESE FIRST – REGARDLESS OF YOUR SCORE

01

Check robots.txt immediately

Verify GPTBot, ClaudeBot, and PerplexityBot are not blocked. This is the #1 AEO failure.

02

Add FAQPage JSON-LD schema

5 real questions from "People also ask". Complete 60-120 word answers. Validate in Rich Results Test.

03

Rewrite your H2s as complete questions

Not 'Benefits'. 'Three Benefits of AEO for SaaS Brands That Run on Google Ads' — specific, semantic, citable.

04

Answer the query in the first 100 words

On every service and pillar page. No preamble. Direct answer first. Context second. Details third.

READY TO MOVE FROM INVISIBLE TO CITED?

Already checked 60+ items? Let's build the system.

Structural readiness gets you to the table.
Topical authority depth and a compounding content system keep you cited.
That is exactly what I build with clients. Let us talk about yours.
