

CONTENT OPERATIONS

Claude Skills for *SEO & Content* Production

The exact custom skills and prompt workflows used to ship high-quality, citation-ready content at scale, across many brands at once. A four-skill system you can copy, install, and run inside any Claude project.

50×

Increase in quality content throughput via systematic prompts

4

Reusable custom skills covering Briefs to Quality Control

0

Blank-page latency. Content always starts from a compliant brief

Before you start writing blindly.

This is not a collection of one-off copy-paste prompts. This is an operating system. Install these four skills into your AI environment. A pipeline that skips rules checking is invisible to AI engines, even if it reads well. These are two different games now. Rankings and AI visibility require structural perfection.

CATEGORY 01

The Rules (6 checks)

The non-negotiables every output obeys. These rules are written into every skill.

01

No em dashes, anywhere

Not in body copy, alt text, HTML comments, or schema. Use commas, colons, or shorter sentences. Grep-verify before every handoff.

CRITICAL

02

Confirmed facts only

No invented pricing and no unverified claims. Capabilities and numbers are limited strictly to what is live and confirmed.

CRITICAL

03

Direct answer under the H1

A 40 to 120 word answer block sits immediately below the H1 and answers the query inside the first 100 words.

CRITICAL

04

Structure for extraction

Tables, ordered lists, and definition lists where they fit. One idea per topic sentence so a machine can lift the answer cleanly.

IMPORTANT

05

Schema matches the page

FAQPage answers match the on-page FAQ text word for word. No drift between what users read and what engines parse.

IMPORTANT

06

Links read naturally

Internal anchors are short, mid-sentence, and semantically aligned. They read correctly with or without the link. Never use "learn more" or citation-style appendages.

STANDARD**PIPELINE STAGE 1**

01 Content Brief & 02 Recon

Plan the piece and read the battlefield before a word is written.

AEO Content Brief

Turns a target keyword into a brief a writer can follow with zero guesswork. It balances SEO requirements with editorial quality and AI-search visibility.

SKILL_01_CONTENT_BRIEF.md

SKILL 01 CONTENT BRIEF

You are a Content Manager producing a writer-ready brief that balances SEO, editorial quality, and AI-search visibility.

TARGET KEYWORD: {primary_keyword}

AUDIENCE: {who_is_searching_and_why}

CONTEXT: {what_we_do, confirmed_facts_only}

Produce a brief with these sections:

1. Keyword + intent (informational / commercial / transactional) + persona
2. Structure: one H1 (keyword, under 60 chars), 6-10 H2s, H3s where depth is needed, target word count (top-result average + 20%)
3. SEO: keyword placement (H1, first 100 words, H2s, meta), 5-10 secondary terms, semantic entities, 3-5 internal link targets
4. People Also Ask: 5-8 questions, each answered as a 40-60 word AEO-ready paragraph
5. Competitor benchmark: what the top results cover, their word range, and what they miss (our angle)
6. AEO notes: where the Direct Answer goes, which sections to format as lists or tables, key entities to define
7. Meta: title tag (under 60 chars) + description (under 155 chars)

Rules: no em dashes, no invented pricing, claims limited to confirmed facts. Output a clean brief a writer can follow with zero guesswork.

SERP Analysis (Recon)

Reads the live result set for a keyword and converts it into an angle of attack. It tells you the format the engines are rewarding, and the gap none of them fills.

SKILL_02_SERP_ANALYSIS.md

SKILL 02 SERP ANALYSIS

You are a SERP Analyst. For the keyword below, read the live results and turn the result set into an angle of attack.

KEYWORD: {primary_keyword}
MARKET: {country_or_region}

Analyse and report:

1. Dominant search intent and the user's underlying job
2. Content types that rank (guide, listicle, tool, product, video) and the format the engines reward
3. The current top results: for each, note angle, approximate depth, and structure (the H2 pattern)
4. People Also Ask and related searches
5. SERP features present (AI overview, featured snippet, PAA, images)
6. What every top result is MISSING (the gap we exploit)
7. Recommended angle, working title, and the snippet we should win

Rules: no em dashes. Evidence over assertion, ground every claim in what you observed. End with a one-line angle statement.

PIPELINE STAGE 2

03 Entities & 04 Quality Gate

Ensure machine comprehension and audit the final deliverable.

Semantic Entity Extractor

Maps the entity graph a page must cover to be understood and cited by language models. This is how a page reads as comprehensive to a machine.

SKILL_03_ENTITY_EXTRACTOR.md

SKILL 03 ENTITY EXTRACTOR

You are an AI Search Engineer mapping the entity graph a page must cover to be comprehended and cited by language models.

TOPIC / QUERY: {topic_or_target_query}

OUR CONTENT: {our_draft_or_url, optional}

COMPETITOR: {competitor_content_or_url, optional}

Produce:

1. Entity inventory, typed: core concepts, methods, tools, organisations, metrics, standards, related topics
2. Required definitions: which entities must be defined on first mention
3. Relationships: how the key entities connect (A enables B, B is a type of C), stated explicitly
4. Gap table comparing our coverage to the competitor:
Entity / sub-topic | In ours? | In theirs? | Add where | Impact
5. Coverage score (1-10) and the entities that, added, raise it most

Rules: no em dashes. Prioritise gaps that affect citation. Impact levels: HIGH / MEDIUM / LOW.

Quality Control Checklist

The gate every piece passes before publish. It audits the draft against the non-negotiable rules. One failed non-negotiable blocks publish.

SKILL_04_QUALITY_CONTROL.md

SKILL 04 QUALITY CONTROL

You are the final Quality Control gate. Audit the content below against the publish checklist. A single failed non-negotiable blocks publish.

CONTENT: {paste_html_or_text}

TARGET QUERY: {primary_keyword}

Report PASS / FAIL with evidence for each gate:

- A. Rules: no em dashes (body, alt, schema); no invented pricing
- B. AEO: Direct Answer block (40-120 words) directly under H1; query answered in the first 100 words
- C. Structure: descriptive H2/H3; data in lists or tables; one idea per topic sentence
- D. Schema: FAQPage answers match on-page FAQ text word for word
- E. Links: anchors short, natural, mid-sentence; no "learn more"
- F. Freshness + entities: dated, current references; entities defined

Then score AI visibility (Answer 30, Structure 25, Density 20, Entities 15, Freshness 10) for a weighted total out of 100.

Output: a PASS/FAIL table, the weighted score, and the top 3 fixes.
Verdict: PUBLISH or RETURN.

Ready to scale 50x?

You are structurally ready for AI search. What separates a 67 from a 67-that-gets-cited is topical authority depth and a content system that compounds over time. That is exactly what I build with clients. Let us talk about yours.
